Constantine

And the Conversion of Europe

A. H. M. Jones

Foveated rendering

called extraordinary ray (E-ray). $R_{max} = (a + b)$ $R_{min} = (a - b)$ Intensity of wave $\therefore I = a^2 + b^2 + 2ab \cos \phi = I_1 + I_2 + 2\sqrt{I_1 I_2} \cos \phi$ where I_1 and I_2 are intensities of two waves. It could not explain interference, diffraction, polarisation. Brewster's Law When unpolarised light is incident at an angle of polarisation (i_p) on the interface separating air from a medium of refractive index μ , then reflected light becomes fully polarised, provided $\mu = \tan i_p$ If angle of polarisation is i_p and angle of refraction is r then $i_p + r = 90^\circ$ Refractive index $\mu = \tan i_p = 1 / \sin C$ where, C = critical angle. Superposition of Waves When two similar waves propagate in a medium simultaneously, then at any point the resultant displacement is equal to the vector sum of displacement produced by individual waves. \therefore Intensity $(I) \propto (\text{Amplitude})^2$ When Source of light is linear, the wavefront is cylindrical. where, μ_0 = absolute magnetic permeability and ϵ_0 = absolute electrical permittivity of free space. Energy of photon = $h\nu = hc / \lambda$ where, h = Planck's constant 6.6 $\times 10^{-34}$ J s
